

CARBON FIBER PREVENTS BACK INJURIES

There is no longer any need for heavy steel core shafts. Double E has sold over 40,000 lightweight carbon fiber shafts since introducing the technology in 1986.

Carbon fiber is stronger than steel at a fraction of the weight.

Safer and easier to handle for operators – prevents costly back injuries.

Less operator fatigue – increases productivity and improves morale.

Advanced material – excellent impact and damage tolerance.

Reduced vibration and shaft deflection – allows higher operating speeds for increased efficiency and more profitable production runs.

Available in bladder air shaft models as well as mechanical models for highly aggressive applications.
